

# Refactoring di un Software per la Prenotazione di Servizi Sanitari

Refactoring of a Software for Booking Healthcare Services

Relatore

Prof. Michele Amoretti

Correlatore

Prof. Andrea Prati

Dott. Fabio Strozzi

Tesi di Laurea di Daniele Pellegrini

## **MAPS** SHARING KNOWLEDGE

Services

Manufacturing

Public Administration

Telco & Utilities

Healthcare

#### APPLICAZIONE PER LA GESTIONE DELLA CODA NELLE STRUTTURE OSPEDALIERE

Profilazione degli utenti

- Miglior gestione logistica della struttura
- o Prevenzione di assembramenti
- Velocità di accesso ai servizi

**EMERGENZA SANITARIA** 

**DOCUMENTAZIONE OBSOLETA** 

### IL PROBLEMA

**CAMBIAMENTO DEL TEAM DI SVILUPPO** 

**AUMENTO DEL NUMERO DI UTENZE** 

**CAMBIAMENTI COMPLESSI E COSTOSI** 

ARCHITETTURA A MICROSERVIZI

**OBIETTIVO** 

## Nuove API REST – Booking Server

#### Documentazione delle API

#### **Swagger**

Tool composto da un set di software open source per progettare, creare e documentare *RESTful APIs* attraverso l'*OpenAPI Specification* 

## Design Pattern Applicati

#### **Inversion of Control (IoC)**

Università degli Studi di Parma

Il codice viene richiamato dai componenti del framework

**Dependency Injection** 

## Design Pattern Architetturali

Università degli Studi di Parma

**DATA TRANSFER OBJECT** (DTO)

Utilizzato per trasferire dati

tra sottosistemi di

un'applicazione software

**DATA ACCESS OBJECT** (DAO)

Disaccoppia il server

dall'accesso al database

#### Framework Utilizzati

**GESTIONE DELLA** 

**COMPLESSITÀ DEL SOFTWARE** 

Implementazione della IoC

mediante Dependency Injection

**MAPPING METODI** 

**JAVA E QUERY SQL** 

Query SQL a carico

del programmatore

## **Booking Server**

**BOOKING SERVER** 

Specifiche OpenAPI e classi service che implementano le chiamate REST

(ms)

#### Test – Nuove API

#### **Test – Risultati Ottenuti**

- Tempo di esecuzione dei thread delle nuove api quasi 20 volte minore
- Incremento della velocità di risposta in tutte le richieste
- Valori di picco meno frequenti e più controllati
- Netto incremento del valore di throughput
- Aumento globale delle performance

## Perché Questo Miglioramento?

A ciascuna nuova richiesta di

accesso al database corrisponde

una **nuova connessione** 

Richieste di accesso al database

mantenute attraverso una

connection pool

## Sviluppi Futuri

ADATTAMENTO DEL FRONTEND

**INSTALLAZIONE** 

REFACTORING DEL DATABASE

## Grazie per l'attenzione.
